Part B: Domain Description

Domain

My visualisation focuses on the changing television and streaming landscape in Australia. I chose this topic because streaming has become a major part of everyday media consumption, while traditional television is also changing in response. The visualisation looks at this shift from several perspectives, including viewing methods, popular streaming services, viewing devices, age differences, catch-up television, broadcaster revenue and advertising spending.

Why and Who

The main purpose of my visualisation is to explain how Australian viewing behaviour has changed over time and how streaming compares with traditional television. It allows viewers to identify major trends, compare different viewing methods and platforms, and recognise important changes such as paid streaming overtaking free-to-air television and advertising spending shifting towards digital formats. The intended audience is a general, non-specialist audience interested in Australian media and viewing trends, so I designed the visualisation to be easy to follow from top to bottom without requiring detailed statistical knowledge.

What

The visualisation uses tabular data from the Australian Communications and Media Authority (ACMA) and the Australian Bureau of Statistics (ABS). These sources are relevant because they provide recent Australian data on television viewing, streaming use, devices, audience behaviour and the television industry. The data includes categorical attributes such as viewing method, platform, service, device and broadcaster; ordered attributes such as year and ranking; and quantitative attributes such as percentages, subscriber numbers, revenue and advertising spending. I also created derived measures including the percentage-point gap between paid streaming and free-to-air TV usage, percentage change in advertising spending, indexed broadcaster revenue and catch-up service rankings. The data was prepared in Tableau by selecting the relevant fields, reshaping tables where needed, and creating calculated fields for these derived measures.

How

I used a range of visual idioms to suit different comparison tasks throughout the story. Multi-

line and small-multiple charts show changes over time, while the dumbbell and slope charts make differences between two time points easy to compare. The ranked bar and lollipop charts support comparison and ranking across categories, while the connected-dot chart highlights differences between age groups. The bump chart shows how catch-up service rankings changed over time. The indexed line chart allows broadcasters with different revenue levels to be compared from a common baseline, while the diverging bar chart clearly separates increases from decreases. The final gap line chart uses a custom-derived percentage-point gap to show when paid streaming moved ahead of free-to-air TV and how this gap changed over time. Position and length are mainly used to compare quantitative values, while lines show changes and connections over time. Colour hue distinguishes categorical attributes such as viewing type, broadcaster and catch-up service. Teal is used to highlight streaming, current values or increases, while grey is used for comparison. Lighter grey is also used for secondary elements such as connecting lines so that the main data marks remain visually prominent. The dashboard is arranged as one vertically scrolling story, with related charts grouped together, annotations highlighting important changes, and tooltips providing additional detail when needed.

Australia’s Streaming Revolution: How Television Viewing Is Changing

Introduction: Streaming has transformed how Australians watch television. This visualisation explores the rise of streaming services, changing viewing habits, popular platforms, and how traditional television is adapting to this shift.

The Shift Toward Streaming

The Tipping Point: Streaming Overtakes Broadcast TV

Share of Australian adults using selected viewing platforms in the past 7 days, 2017–2025

The Rise of Streaming Services

How Viewing Changed: 2017–2025

Change in the share of Australian adults using each viewing method

How Australia’s Major Online Platforms Evolved

Share of Australian adults using selected online platforms in the past 7 days (%), 2017-2025

Australia’s Favourite Streaming Platforms

Australia’s Leading Streaming Services in 2025

Australian streaming subscriber numbers, 2025

Why Australians Prefer Streaming

How Viewing Devices Shifted: 2020–2025

Share of Australian adults using each device in the past 7 days (%)

Screen Viewing Dominates Australians' Free Time

Share of Australians aged 15+ participating in selected free-time activities, 2024 (%)

Screen Viewing Becomes More Common With Age

Share of Australians participating in watching TV or streaming, by age group, 2024 (%)

Traditional Television Is Adapting

Traditional TV Is Adapting Through Catch-Up Streaming

Ranking of free-to-air catch-up TV services used by Australian adults in the past 7 days, 2017–2025

The Changing Economics of Television

Traditional TV Revenue Has Diverged Across Broadcasters

Indexed television revenue of selected Australian broadcasters, first available year = 100

Advertising Spend Is Shifting Toward Digital TV

Percentage change in Australian television advertising spending by format, 2023–2029 forecast

Where Australia Stands Today

Streaming's Lead Over Free-to-Air TV Has Widened

Percentage-point gap between paid streaming and free-to-air TV usage, 2017-2025

Conclusion

Australia's television landscape has shifted strongly toward streaming. Paid streaming moved from well behind free-to-air TV in 2017 to leading it by 2025. At the same time, viewing devices, platform use and advertising investment have increasingly moved toward digital delivery. Traditional television remains important, but catch-up services and changing broadcaster strategies show an industry adapting to a more streaming-centred environment.
